BIM & Sustainable Design A Look at 3-D Design Tools for Sustainable Building

This month's ELUG event will feature a discussion on the emergence of 3-D modeling software "add-on applications" that are intended to assist the design team in making more sustainable choices at early stages of the project. As most design/construction professionals know – once the building design has progressed into Design Development, many choices that impact energy performance have already been made. Energy models (run during and after DD) provide useful information, but at that point it may not be feasible to make substantial changes to the design.

Come learn more about the current state, and future, of 3-D design as it relates to green building from Eric Anderson, Jason Dardis, and Kate Costanza of MG2. They will share their experience with various applications that MG2 uses to analyze a building's design energy performance. We will look at the current state of these applications, how they can be used, what information is required, and what the future holds.

Please RSVP to elug@gly.com ~ continental breakfast is provided
